

STANDARD OPERATING PROCEDURE

Twin Text Platform

Lead Text-Revival Campaign

How to run the lead-texting automation — from installing the app to saving the daily report.

Document: Operating Guide

Applies to: Twin Text Platform desktop app & web dashboard

Audience: Campaign operators

1. Overview — what the tool does

Twin Text Platform works your leads for you. You load a list of leads and press Start; the tool then handles every lead the same way, automatically — searching, checking the rules, sending the correct approved message, and recording the outcome. You never type a message or decide who to text.

For each lead, the tool performs the following steps in order:

- 1. Find the lead in REI.** It searches REI BlackBook by property address, owner name, or phone number and opens that contact.
- 2. Check that it is allowed to be texted.** Is the property in California? Has it already been texted this month? Is the contact opted out, marked “do not text,” sold, listed, or a wrong number? If any apply, the lead is skipped — no message is sent.
- 3. Select the correct message.** The tool reads whether the lead belongs to Equity Track (EQT) or Twin Home Buyer (THB) and uses that company's approved message — never the other.
- 4. Send and confirm.** It sends the approved text, then confirms the message actually went out before marking the lead “Text Sent.”
- 5. Record the result.** The outcome is shown on the dashboard and saved for the report, so results are accurate and no lead is ever texted twice.

In short

You load the leads and press Start. The tool does the searching, the safety checks, the correct message, and the record-keeping — for hundreds of leads — exactly the same way, every time.

What this version includes

- **Auto-continue batches.** Sends 100, pauses, then automatically continues the next 100 until every lead is done or you press Stop.
- **No repeats this month.** A lead already texted this calendar month is skipped; leads already worked this month reappear with their result filled in (not re-checked).
- **California only.** Out-of-state leads are skipped (their REI link is still shown).
- **Correct company every time.** EQT vs THB is detected from REI; if unclear, the lead is held, never guessed.
- **Accurate results.** “Text Sent” only when delivery is confirmed; unconfirmed leads are held and retried, never falsely marked.
- **Daily report.** Today + This Month sections, with one-click **Save as PDF** (no printer needed).
- **Team share link.** The dashboard shows a WiFi address teammates can open in a browser.
- **Self-healing.** If the browser closes mid-run, the tool reopens it and continues.

2. Download and install the app

One-time setup, performed once per computer.

Download the installer from Google Drive:

Download Twin Text Platform (Google Drive)

<https://drive.google.com/file/d/1nMiigz2anRCGX40yHU3sxjbmrVQiEq0U/view?usp=sharing>

1. **Open the link and download.** Open the Drive page, then click the **Download** button (top-right). Save the file.
2. **Run the installer.** Open the downloaded **Twin Text Platform Setup** file. If Windows shows a blue “Windows protected your PC” notice, click **More info**, then **Run anyway** — the file is safe; the message only appears because it is not distributed through the Microsoft Store.
3. **Finish and open.** Complete the installation. A **Twin Text Platform** icon is added to the desktop. Double-click it to open the tool.

Multiple users

Each person installs their own copy from the same Drive link, on any computer or network. All copies operate through the single shared REI account, so runs do not conflict and no lead is texted twice.

3. Opening the tool and first-time login

Double-click the **Twin Text Platform** desktop icon to open the dashboard. (On the main office computer, the same dashboard can also be opened in a web browser at

`http://localhost:3000` while the program is running.)

First run only — log in to REI

The first time you run the tool, a browser window opens on the REI BlackBook login page. Log in there once, by hand. The login is remembered afterward, so you will not need to log in again on future runs.

4. Loading your leads

Choose one of the two options below.

- **Upload a spreadsheet.** Click “**Choose File**” and select your CSV or Excel file. The tool reads your columns automatically and keeps them all.
- **Pull all from REI.** Click “**Pull all from REI**” to bring in every contact directly from REI — no file required.

Leads already worked this month are remembered

Any lead worked earlier this month appears with its result already filled in and is skipped, not repeated. Only new leads are worked. This record resets automatically at the start of each calendar month.

5. Running the automation

Set it up once, press Start, and let it run.

1. **Turn on Live Sending.** Click **“Live Sending: OFF”** so it changes to **“Live Sending: ON.”** When OFF, the tool checks everything but sends nothing (safe practice mode); when ON, real text messages are sent.
2. **Set the batch size.** Set **“Texts per run”** to **100** and leave **“Auto-continue”** checked. The tool sends 100, pauses briefly, then automatically continues with the next 100.
3. **Press Start.** Click **“Start Live Automation.”** The tool works down the list on its own and keeps going, batch after batch, until every lead is finished or you press Stop.
4. **Monitor progress.** The summary cards and the table update live as leads are worked. Links open the contact in REI or the property on Redfin for a quick check.
5. **Stop when finished.** Click **“Stop”** to end your shift. Progress is saved; the next time you press Start, it resumes the unfinished leads and skips those already completed.

6. Understanding the results

Each summary card can be clicked to filter the table to only those leads.

Result	What it means
■ Text Sent	The approved message was confirmed sent to a clean, eligible lead.
■ Property Sold / Listed	The property is sold or currently listed. Not texted.
■ Not Interested / Opt Out	The lead declined or opted out of messages. Not texted.
■ To Delete / Bad Leads	Wrong number, failed number, bad lead, or not found in REI.
■ Out of State	Property is outside California and is never texted. The REI contact link is still shown for reference.

Leads that are re-checked automatically

A small number of leads that the tool cannot confirm cleanly (for example, when it cannot determine EQT versus THB) are held and re-checked automatically on the next run. Nothing is sent for these; they simply try again later, which is why they are not shown as a separate category.

7. Automatic safety rules

These rules are always enforced. No action is required from the operator.

- **California only.** Any property outside California is skipped as Out of State.
- **Never twice in one month.** A lead already texted during the current month is skipped.
- **Correct company every time.** The tool determines whether the lead is EQT or THB from REI and sends that company's message. If it cannot determine the company, it holds the lead rather than risk sending the wrong message.
- **Opt-outs and blocking tags respected.** If REI indicates the contact is opted out or should not be texted, no message is sent.
- **Accurate “Text Sent” status.** A lead is marked “Text Sent” only when delivery is confirmed. If a send cannot be confirmed, it is held for another attempt and never falsely marked.

How eligibility is decided (the full flow)

For each contact, the tool checks these in order and stops at the first one that applies.

1. Is the property in California?

No → ❌ Out of State. We only work CA.

2. Can we find the lead in REI? (address → owner → phone → email)

No → ❌ Lead Not Found.

3. Can it read the contact info clearly?

No → ❌ Lead Not Found. (Never guesses a name or number.)

4. Is the property sold or listed? (REI tags + Redfin)

Yes → ❌ Sold / Listed. **Also:** if Redfin shows the property **sold AFTER our last contact** with the lead (they sold it since we last spoke), it's treated as Sold and skipped — even if the sale is older than the usual recent-sale window.

5. Bad-tag / opt-out scan (tags + notes + full chat history):

- Do Not Automate → ❌ Skip
- Opt-out / Do Not Contact / DNC / STOP / unsubscribe / remove me → ❌ Opted Out
- Low Equity / We're Passing / Not a Fit / Not Qualified → ❌ Bad Lead
- Not Interested → ❌ Not Interested
- Wrong Number → ❌ Wrong Number
- 2 or more bad tags → ❌ Bad Lead

6. **Active-deal tag?** (Offer Sent / Appointment Booked / Follow up)
 - Conversation within ~a month →  Recent Contact (don't disturb an active deal)
 - Cold ~a month or more →  Continue (safe to re-engage)
7. **Did the last text fail or not deliver?**
Yes →  Failed Number.
8. **Did we already send the revival text?** (anywhere in the REI thread)
Yes →  Already Contacted.
9. **Already texted this month?**
Yes →  Texted This Month.
10. **Usable phone number?**
No →  Lead Not Found.
11. **Company clearly EQT or THB?**
Can't tell → ■ Held (never guesses the company).
12. **Passed everything?**
 Clean — send the correct company's approved message (EQT or THB). Marked **Text Sent** only after the send is confirmed; if it can't confirm, it's held and retried (never falsely marked).

The approved messages (locked)

To avoid carrier spam-blocking from identical copy, the app keeps a **pool of 5 approved templates per company** and picks one **at random** for each send. The wording below is for Twin Home Buyer; Equity Track Inc. uses the same set with its own company name.

Twin Home Buyer — preferred

“Hi {{first_name}}, it's Juan with Twin Home Buyer. You reached out about your property a while back, and I realized we never heard what you ended up doing with it. Did you end up selling it, or do you still have it?”

Variant 2

“Hi {{first_name}}, Juan here with Twin Home Buyer. I was looking back through our notes and saw we never found out what happened with your property. Did you end up selling, or are you still holding onto it?”

Variant 3

“Hi {{first_name}}, it's Juan with Twin Home Buyer. I was reviewing some older conversations and yours came up. Just curious—what ever happened with the property?”

Variant 4

“Hey {{first_name}}, it's Juan with Twin Home Buyer. Been a while since we last talked. Is the property still yours, or did you end up selling it?”

Variant 5

“Hey {{first_name}}, Juan with Twin Home Buyer. Quick question—did you ever end up selling the property, or do you still have it?”

{{first_name}} is automatically replaced with the contact's first name from REI. When no name is known it reads “Hi there,” so it never sends a blank or a literal `{{first_name}}`.

How the random message is checked

The message is random, so the safety checks recognize **any** of the templates — a lead is never double-texted and a send is never falsely marked.

1. **Pick (sending)** — right before each text, the app randomly chooses one of the 5 templates for that company. Each send is its own independent pick (not a fixed 1-2-3-4-5 order), so the wording is unpredictable.
2. **Duplicate check (before sending)** — the app scans the REI chat for a distinctive phrase from **each** of the 5 templates (plus the older wording). If any is found, it knows a revival text was already sent — no matter which template, computer, or REI account sent it. Found **this month** → skip; found in a **prior month** → allowed to re-text; phrase there but **date unreadable** → skip to be safe.
3. **Send confirmation (after sending)** — it then looks in the chat for a piece of the **exact** message it just sent (the specific random one). Only when that appears is the lead marked **Text Sent**. If it can't confirm, the lead is held and retried — never falsely marked.

8. The daily report

At the end of a shift, click **“Daily Report.”** The report opens inside the tool and shows two sections:

- **Today** — only the leads worked today (the shift's numbers), with a short summary line.
- **This Month so far** — the running total for the entire month.

Use **“Save Today”** or **“Save This Month”** to download a clean, one-page **PDF** report. It saves directly to the Downloads folder; no printer is required.

9. Sharing with your team

There are three ways for a team to use the tool. Choose the one that fits.

Option A — One host computer, team opens a link (same office WiFi)

One person's computer runs the tool (the “host”); everyone else in the same office simply opens a link in their browser. No installation for the team.

1. **On the host computer, start the tool.** Run it (app icon, or **start-windows.bat** for the code version). When Windows asks to **allow network access**, click **Allow**.
2. **Find the share link.** The dashboard shows it at the top: **“Share this dashboard with teammates on this computer's WiFi — <http://192.168.x.x:3000>.”**
3. **Teammates open that link.** Anyone on the **same office WiFi** opens that address in their browser and sees the host's dashboard. They install nothing.

Notes for Option A

The host's window must stay open and the computer on. Only one person should operate (click) at a time. Updating the host updates it for everyone on the link — teammates are all viewing the one host instance.

Option B — Remote access with AnyDesk (any location)

If a team member is not on the host's WiFi, they can use AnyDesk to remote into the host computer and operate it on-screen. They see and control the host's dashboard directly. AnyDesk works over any internet connection — the same WiFi is not required. One person operates at a time.

Option C — Each person runs their own copy

For fully independent work, each person installs their own copy from the Google Drive link (Section 2) and logs into the shared REI account. Because of the “already texted this month” rule and REI's shared history, no lead is ever texted twice — even if several people run at the same time.

Keeping copies updated

Code-version hosts update with **update-windows.bat** (which pulls the latest) and then **start-windows.bat**. Desktop-app users get updates by installing a refreshed installer from the Google Drive link.

10. Updating the tool (from GitHub)

New versions are published to GitHub. How you update depends on which way the computer runs it.

Desktop-app computers (run from the icon)

These get updates by rebuilding the app from the latest code. On a computer set up with the code (Node + Git), it is one double-click:

1. **Close the Twin Text Platform app** (and any black command window) so files aren't locked.
2. **Double-click Update-App-Windows.bat.** It pulls the latest from GitHub, rebuilds the installer, and points to it.
3. **Install the new file.** Open the **dist** folder and double-click **Twin Text Platform Setup 1.0.0.exe** — it replaces the old app; your REI login and data are kept.

First-build note

The very first build downloads its tools and is slow (several minutes) — that is normal. If it fails with a “symbolic link / winCodeSign” message, turn on **Windows Developer Mode** once (Settings ► Update & Security ► For developers ► Developer Mode = On), or run the file as Administrator, then run it again. Later updates are fast.

Host / code computers (run with start-windows.bat)

These run straight from the code, so updating needs no rebuild:

1. **Double-click update-windows.bat** — it pulls the latest from GitHub and installs any new components.
2. **Double-click start-windows.bat** to run again. Teammates on the share link get the update automatically (they view this one computer).

If a computer does not have the code yet (one-time setup)

Install **Node.js** (nodejs.org, LTS) and **Git** (git-scm.com), then in Command Prompt run:

```
git clone -b claude/equity-lead-revival-dashboard-xl9l8j https://github.com/rosanes-cmyk/Revival-Ai-.git Revival-Ai-
```

After that, use the double-click scripts above.

11. Troubleshooting

Situation	What to do
A login page appears	Log in once in that window. The login is remembered afterward.
Nothing is being sent	Confirm that Live Sending is ON (green). OFF is safe practice mode.
The browser closed by itself	No action needed — the tool reopens it and continues automatically.
A lead shows “Text Sent” but you are unsure	Click “Re-verify Sent.” The tool checks REI and corrects any that did not truly send.
You want errored leads re-checked	Press “Start” again. The tool re-works anything unfinished and skips what is already done.
